

Supervised & Unsupervised ML

1. **Supervised ML:** - In this we have dependent and independent variables. There is only one dependent variable and one or more than one independent variable. There are different-different models we can use in supervised ml according to nature of dependent variable.
 - **Classification:** - In this dependent variable is of categorical nature. We have models like Logistic Regression, Decision Tree, Random Forest etc
 - **Regression:** - In this, dependent variable is of numerical nature. We have models like Linear Regression, Decision Tree Regressor, Random Forest Regressor etc.

2. **Unsupervised ML:** - In this we have independent variables. We can classify that data points in groups or find anomaly value from data points. In this we have models like clustering, anomaly detection model.
